1. Climate change is the biggest challenge for humanity in the next decade. To overcome it we must work together. This crisis arose due to an unlimited expansion in a limited environment – our planet. Consequently, humanity has managed to put a significant impact on the global climate. While the climate does change by itself, humanity has accelerated this pace immensely. The release of greenhouse gases has caused the poles to melt, and in effect, the water level is rising at an unprecedented rate, causing millions of people to flee from their homes and livelihoods.
2. Climate change is the emission of greenhouse gases and global warming. Climate change is our generation's most prominent and crucial challenge. We are facing a situation where the solution requires drastic changes in the way we live our lives and what habits we have. It is crucial that we become less dependent on fossil fuels, and rather make greater investments in green energy. Extensive international cooperation is absolutely necessary to achieve the goals we have set ourselves, and for future generations to also enjoy the planet.
3. Climate change is a dangerous pandemic, that has swept through the population the last 100 years. Though not a real pandemic, in the literary sense, the people's mindset, that is the prelude to the actual climate change, has spread like wildfire throughout the globe, the last couple of centuries. As a result, as the ocean rises, as the forests burn down, as the crops dries out and as houses are destroyed by hurricanes, humans are driven from their homes. Thus, the climate change, is also a human change.
4. "Climate change is an issue that we know and will need to address", said U.S. National Climate Assessment Director for Climate Change Science and Policy, Tom Waring. "The fact is that the amount of carbon dioxide released from this Earth's atmosphere has been increasing by about one-third over the last 50 years, and we must work together to mitigate that trend." To combat the problem, the U.S. and other developed nations are taking steps to regulate greenhouse gases as well.
5. Climate change is our generation's greatest crisis. To resolve this crisis, we must focus all our time and resources on changing our current way of life. We have to live more consciously and make better choices. Although many individuals are doing what they can to help this cause, the initiative from the people in charge is not nearly good enough. Greta Thuneberg said "I want you to act as if your house is on fire. Because it is."
